

# QUICK GUIDE TO BACKING-UP A RECORDED INCIDENT

You need to know the date and time which the incident happened and you find this by playing back:

1. Press SEARCH.
2. Enter the approximate start day and time using the arrow keys.
3. Select <begin playback> and press enter.

During playback you can fast forward and reverse using the remote control until the incident is found.

Once the incident is starting press COPY to mark the start and COPY again to mark the end of the incident. Keep these two markers as close together as possible - i.e. just the actual event – with as little as possible before and after the event.

When prompted, load a CDRW disk into the drive or a USB stick. The video between the two presses of the COPY button will be written to the disk/USB.

When the event is written, the DVR will tell you on the screen and eject the disk. The DVR also writes the reading software on the disk so that the event can be played back on any PC.

See page 26 of the manual for more in-depth instruction. Manuals are also available for download from our site free of charge for distribution.
